                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            49 VQDLEQKMKVVENLQDDFDFDFNYKTLKSQGDMQDLNGNNQSVTRQKMQQLEQMLTALDQMR 108
                                                                                                                                                                                                                                                                                                                              The present sequence is mouse Stat3 protein fragment containing 107-377 amino acids of Stat3 protein. This Stat3 fragment showed strong binding to c-Jun protein in the cell extract. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a method Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriasis. A Stat protein comprises the N-terminal domain, colled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Signal transducer and activator of transcription; STAT; 19sf6; Stat3; receptor recognition factor; transcription factor; cellular debilitation; derangement; dysfunction; interferon-gamma.

A fragment encoding the human Stat91 protein was used to screen a murine thymus and spleen cDNA for homologous proteins. A highly homologous gene (given in AAQ89318) was isolated that encoded a 91 kDa protein (AAR72080) (Stat1) that was responsive to interferon-gamma. Using a fragment of the mouse gene as probe, 2 additional members of the 113-91 family of receptor recognition factor proteins were isolated. The 2 genes (AAQ89319-40) were cloned in plasmids 138fl and 198ff and encoded proteins termed Stat4 (AAR72081) and Stat3 (AAR72082), respectively. (Updated on 25-MAR-2003 to correct PN field.)

--- FUNCTION: Transcription factor that binds to the interleukin-6
--- FUNCTION: Transcription factor that binds to the interleukin-6
--- FUNCTION: Transcription factor that binds to the promoters of various (IL.6) -reapponaive elements identified in the promoters of various acute-phase protein genes.
--- FATHWAY: Involved in the gp130-mediated signaling pathway.
--- FATHWAY: FORMS a homodimer or a heterodimer with a related family member (at least STAYI). Interacts with NCOAI.
--- SUBCELLULAR LOCATION: Cytoplasmic; translocated into the nucleus in response to phosphorylation.
--- ALTERNATIVE PRODUCTS:
--- Event-Alternative splicing; Named isoforms=2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolda-P40763-2; Sequence-VSP 010474;
Isolda-P40763-2; Sequence-VSP 010474;
TISSUE SPECIFICITY: Heart, brain, placenta, lung, liver, skeletal muscle, kidney and pancreas.

PIN: Tyrosine phosphorylated in response to IL-6, IL-11, CNTF, LIF, CSF-1, EGF, PDGF, IFN-alpha and OSM. Serine phosphorylation is important for the formation of stable DNA-binding STAT3 homodimers and maximal transcriptional activity.

SIMILARITY: Belongs to the transcription factor STAT family.

SIMILARITY: Contains 1 SH2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PubMed=11773079; DOI=10.1074/jbc.M111486200;

PATHWAY: Involved in the gp130-mediated signaling pathway.
SMBUNIT: Forms a homodimer or a heterodimmer with a related family member (at least STATI). Interacts with NCOA1 (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic; translocated into the nucleus

Seyfert H.M., Wheeler T.T., Moolenaar A., Pitra C.,
Submitted (JAN-2004) to the EMBL/GenBank/DDBJ databases.
-! FUNCTION: Transcription factor that binds to the interleukin-6
(IL-6)-responsive elements identified in the promoters of various acute-phase protein genes (By similarity).
-!- PATHWAY: Involved in the gp130-mediated signaling pathway.
                          PTM: Tyrosine phosphorylated in response to IL-6, IL-11, CNTF, ILF, CSF-1, EGF, PDGF, IFN-alpha and OSM. Serine phosphorylation is important for the formation of stable DNA-binding STAT3 homodimers and maximal transcriptional activity (By similarity). SIMILARITY: Belongs to the transcription factor STAT family. SIMILARITY: Contains 1 SH2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

-!- SUBUNIT: Forms a homodimer or a heterodimer with a related family member (at least STAT1). Interacts with NCOA1 (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic; translocated into the nucleus in response to phosphorylation (By similarity).
-!- SIMILARITY: Belongs to the transcription factor STAT family.
-!- SIMILARITY: Contains 1 SH2 domain.
                                                                                                                                                                                                                                                                                                                                       (By similarity).

The present sequence is mouse Stat3 protein fragment containing 249-377 amino acids of Stat3 protein. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-un and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriasis. A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Location/Qualifiers

                                                                                                                                                                                                                                  The present sequence is mouse Stat3 protein fragment containing 193-377 amino acids of Stat3 protein. The invention relates to methods for identifying interacting regions of transcription factors and methods for transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriais. A Stat protein comprises the N-terminal domain, coiled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation domain

```
The present sequence is mouse Stat3 protein fragment containing 155-377 amino acids of Stat3 protein. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriasis. A Stat protein comprises the N-terminal domain, coiled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation domain
Identifying an agent for use in modulating the interaction between transcription factor c-Jun and a Stat3 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is mouse Stat3 protein fragment containing 107-377 amino acids of Stat3 protein. This Stat3 fragment showed strong binding to c-Jun protein in the cell extract. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of typroliferative diseases and also for treating cancer and psoriasis. A Stat protein comprises the N-terminal domain, coiled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation domain
                                                                                                                                                                                                                                                                                                                                                                           Mouse; Stat3 protein; transcription factor; c-Jun; gene transcription; cellular transformation; dysproliferative disease; cancer; psoriasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription 3 (Stat3). Modulating angiogenesis is useful for treating or preventing

```
tissue ischaemic condition or disorder which is the result of stroke, ischaemia, coronary atherosclerosis, myocardial infarction, inflammation, tissue ischaemia in the lower extremities, infarction, tranuma, vascular occlusion, prenatal or postnatal oxygen deprivation, suffocation, shock, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, epilepsy, emphysema, adult respiratory distress syndrome, cardiac arrest, critogen necrosis, proliferative angiopathy e.g. diabetic microangiopathy with neovascularisation. Suppressing an immune response is useful for ameliorating a symptom of an autoimmune disease such as systemic lupus crythematosus, multiple sclerosis, insulin dependent diabetes mellitus, crythematosus, multiple sclerosis, insulin dependent diabetes mellitus, crydematosus, multiple sclerosis, insulin dependent diabetes mellitus, crydematosus, multiple sclerosis, insulin dependent diabetes mellitus, crydematosus, sulcinamy biliary cirrhosis, pernicious mixed connective tissue disease, primary biliary cirrhosis, pernicious cracainoma, autoimmune purpura, drave's disease, valuematoid arthritis, diapethic Adaison's disease, valuematoid arthritis, cirrhosis, pemphygus vulgaris, autoimmune crifity, bullous pemphigoid, discoid lupus, ulcerative colitis and dense deposit disease. The method is useful in preventing or treating carcinomas e.g., bladder carcinoma, colon carcinoma, chomose e.g., bladder carcinoma, colon carcinoma, cromas and carcinoma, degenerative disorders, growth deficiency, hypoproliferative disorders, physical trauma, lesions and wounds. The method is also used in gene therapy. The present sequence is human cross at the present sequence is human cross and carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

```
The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample comprising the expression profile of a gene group in the sample comprising selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB19202 to AB19912), encoding the protein sequences in ABB5702 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. AB199913 and AB199914 represent primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Modulating angiogenesis and an immune response in an individual, for treating a hypoxic or ischemic condition, comprises administering a compound that modulates the activity of a signal transducer and activator of transcription 3.

Disclosure; Page 83-85; 94pp; English.

coclusion, prenatal or postnatal coxygen deprivation, transmin, vasculation constructive pulmonary disease, choking, asphyxia, hypoglycaemia, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, capilepsy, emphysema, adult respiratory distress syndrome, carrest, nitrogen necrosis, proliferative angiopathy e.g. diabetic microangiopathy with neovascularisation. Suppressing an immune response is useful for ameliorating a symptom of an autoimmune disease such as systemic lupus crythematosus, multiple sclerosis, insulin dependent diabetes mellitus, slogren's syndrome, scleroderma, polymyositis, chronic active hepatitis, mixed connective tissue disease, primary biliary cirrhosis, pernicious maemia, autoimmune thyroiditis, didopathic Addison's disease, vitiligo, gluten sensitive enteropathy, autoimmune neutropenia, myasthenia gravis, disease, theumatoid arthritis, cirrhosis, pemphigus vulgaris, autoimmune infertility, bullous pemphigoid, discoid lupus, ulcerative colitis and disease. The method is useful in preventing or treating carcinomas e.g., bladder carcinoma, colon carcinoma, chronic leuksemia, myasthenia, myasthenia gravis, humbored it infertility and oncogenic disease which includes sarcomas and carcinomas e.g., bladder carcinoma, colon carcinoma, chronic leuksemia, myasthenia, myasthenia, myasthenia, myasthenia, myasthenia, myasthenia, proventing or treating carcinomas e.g., bladder carcinoma, colon carcinoma, chronic leuksemia, myasthenia, myasthe The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription 3 (Stat3). Modulating angiogenesis is useful for treating or preventing hypoxic or ischaemic condition or disorder which is the result of stroke, ischaemia, coronary atherosclerosis, myocardial infarction, inflammation, tissue ischaemia in the lower extremities, infarction, asscular physical trauma, lesions and wounds. I herapy. The present sequence is human method is also used in gene therapy. The pi protein related to angiogenesis regulation disorders, hypoproliferative

                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A fragment encoding the human Stat91 protein was used to screen a murine thymus and spleen cDNA for homologous proteins. A highly homologous gene (given in AAQ9938) was isolated that encoded a 91 kDa protein (AAR72080) (Stat1) that was responsive to interferon-gamma. Using a fragment of mouse gene as probe, 2 additional members of the 113-91 family of receptor recognition factor proteins were isolated. The 2 genes (AAQ89339-40) were cloned in plasmids 13sfl and 19sf6 and encoded proteins termed Stat4 (AAR72081) and Stat3 (AAR72082), respectively. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                Signal transducer and activator of transcription; STAT; 198f6; Stat3; receptor recognition factor; transcription factor; cellular debilitation; derangement; dysfunction; interferon-gamma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Receptor recognition factor implicated in transcriptional stimulation of genes - useful in drug screening assays and/or for treating cellular debilitations, derangements and/or dysfunctions, etc.

The protein is encoded by a cDNA, isolated from a mouse liver cDNA library using a polymerase chain reaction product (amplified using primers derived from an IL-6-treated mouse liver peptide) as a probe. APRF-inhibitors, e.g. antibodies, antisense oligonucleotides or ribozymes, may be used to treat diseases induced by IL-6, e.g. inflammatory disease, leukemia, cancer, osteoclasia, pulmonary
Mouse; acute phase response factor; transcription factor; interleukin-6; signal transmission; liver; antibody; antisense; ribozyme; antiinflammatory; antitumor; hypotensive; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse signal transducer and activator of transcription (STAT) protein STAT4 (AAW03176) serves a dual purpose, i.e. signal transduction from ligand-activated receptor kinase complexes followed by nuclear translocation and DNA binding to activate transcription. Recombinant STAT4 can be obtd. using cDNA clone 198f6 (AAT31278) obtd. from splenic/thymic cells. STAT4 includes a DNA-binding domain (see also AAW03167) capable of both receptor recognition and message delivery via DNA binding in a receptor-ligand specific manner. STAT proteins and their DNA binding domains (see also AAW03165-75) are useful for screening antagonists used to inhibit STAT-mediated signal transduction and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    368
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                249 IACIGGPPNICLDRLENWITSLAESQLQTRQQIKKLEELQQKVSYKGDPIVQHRPMLEER 308

The encoding sequence differs from the original published human STAT3 gene sequence (Akira et al., 1994). Host cells comprising a recombinant STAT3 DAM molecule can be used for the recombinant expression of the variant. STAT3 protein is useful as a medicament or pharmaceutical composition for treatment of autoimmune or inflammatory diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        309 IVELPRNIMKSAPVVERQPCMPMHPDRPLVIKTGVQFTTKVRLLVKFPELNYQLKIKVCI 368

                                                                   ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a crystal of an N-terminal fragment of a signal transducer and activator of transcription (STAT) protein. The crystal effectively diffracts X-rays, allowing the determination of the atomic coordinates of the N-terminal domain to a resolution of greater than S.O Angstroms. The present sequence is the N-terminal domain of greater murine STAT 3 protein. The N-terminal domain enables STAT dimers to interact and bind DNA cooperatively, a mechanism important for gene activation. The crystals are useful in drug screening and development by selecting a potential drug by performing rational drug design with the 3-dimensional structure determined for the crystal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New crystals of an N-terminal fragment of a signal transducer and activator of transcription that effectively diffracts x-rays, useful for drug screening and development.

The invention relates to methods for detecting compounds that bind to signal transducer and activator of transcription (STAT) proteins for the discovery and development of new drug compounds based on the structural properties of the protein crystal. The methods include: identifying a compound that binds to the N-terminal domain of a STAT protein, compound that enhances or diminishes the binding of the identifying a compound that enhances or diminishes the ability of site; or identifying a compound that enhances or diminishes the ability of STAT protein dimers to induce the expression of a gene operably under the control of a promoter containing at least two adjacent weak binding sites for STAT protein dimers. The methods are used for identifying new drugs. An antagonist of STAT N-terminal dimeric interactions that control of a gene operably under containing at the treatment of a promoter of a gene, could be useful as drugs in the treatment of diseases, e.g. inflammation, allergy, asthma and leukaemias. On the other can be used as drugs in the treatment of diseases e.g. anaemia, can be used as drugs in the treatment of diseases e.g. anaemia, contropaemia, thrombocytopaemia, cancer, obesity, viral diseases and content by the present sequence is murine STAT3 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

(forming a protein-protein interaction map, PIM) in adipocyte cells as defined in the specification, or polymucleotides in adipocyte encoding for the polypeptides. Also included are a recombinant cell expressing the interacting polypeptides and a method of selecting a modulating compound in adipocyte cells, by cultivating a recombinant host cell on a selective medium containing a modulating compound and a reporter gene the expression of which is toxic for the recombinant host cell which is transformed with two vectors, where the first vector comprises a polymucleotide encoding a first hybrid polypeptide and DNA binding domain and the second vector comprising a polymucleotide encoding a second vertor comprising a polymucleotide encoding a second reporter gene, when the first and second hybrid polypeptides interact and selecting the modulating compound which inhibits the growth of the recombinant host cell (i.e. using the yeast two-hybrid system). The

protein interactions and useful for treating obesity and metabolic
disorders e.g. non-insulin dependent diabetes mellitus, NIDDM. The
compound isolated by the method is useful for treating and preventing
obesity or metabolic diseases. The interactions between the proteins of
the complex further define a set of selected interacting domains, SID.
